IT was no light task to undertake and bring to a successful issue the second Decennial Index to the BRITISH JOURNAL OF SURGERY. The present volume is detailed and accurate. The thanks of the subscribers, therefore, are due to the compilers, the proof readers, and the other members of the staff employed by Messrs John Wright & Sons Ltd for the manner in which they have done their work.

A study of the Index shows that it is much more than a work of reference. It marks a further stage in the progress of British surgery. The first Decennial Index showed that War surgery dominated the latter years of the period. This second volume proves that surgeons have returned to civil work with renewed ardour, they are now devoting their attention more especially to the surgery of the nervous system, the alimentary canal, the liver, and the ductless glands. It also points out that surgery is developing a special language. Many of the terms employed are new, useful, and expressive, but their multiplication will soon need an explanatory dictionary.

EXPLANATORY NOTES TO THE INDEX

Proper names are printed in two ways. Where small *capital* letters are used (RUSSELL, HAMILTON) it signifies an original article by the writer in the JOURNAL. When *small* letters are employed (Russell, Hamilton) it means a reference only.

Rules (— — etc.) are employed in order to avoid the repetition of words. In these cases *significant* words only are recognized, others such as *a, the, an, of, in*, etc., being disregarded.

Book Reviews will be found in two lists: first under their titles, and again under the name of the author. The first list is subdivided into such headings as Abdominal Surgery, Anæsthesia, Bones and Joints, etc.
